```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

It can be used in the production of p39.5 or fragments of it which may be used to raise antibodies to, and in the development of vaccines against Lyme disease. The sequence can also be used for making primers and probes for diagnosis, also in DNA vaccines, as antisense therapeutics and for drug screening. Antibodies can be used as diagnostic (immunoassay) reagents, for treating Lyme disease, for affinity purification, for drug screening and to produce anti-idiotype antibodies (used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can abe used for detection of members of the Borrelia genus.

They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can be used for detection of members of the Borrelia genus.

Portions of several of the 15 silent vis cassette sequences, located approx. 500 bp upstream of visE, recombine into the central visE cassette region during infection, resulting in antigenic variation and hence immune evasion, long-term survival and pathogenesis in the mammalian host.
                                                                                                                                                                                                                                                                                                                                                       This protein comprises the surface-exposed lipoprotein variable major protein (VMP)-like protein VISE of Borrelia burgdorferi. sequence was deduced from an isolated VISE gene (see AAT85042). sequence was deduced from an isolated vISE gene (see AAT85042) elaborate genetic system has been identified that promotes extensive antigenic variation of VISE. An infectivity related 28-kb linear plasmid, pBB281a, of B. burgdorferi B31 contains a

                                                                               This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can albe used for detection of members of the Borrelia genus.

                                                                                                                                                                            This sequence represents a Borrelia burgdorferi (Bb) protein of the invention, which is suitable for use in a vaccine. The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can all be used for detection of members of the Borrelia genus.

                                                                                                                                                                                                                                                                                           The present sequence is that of orb-weaver spider (Nephila clavipes) CC recombinant silk protein pQE((SP1)4/(SP2)1)4. The invention CC provides methods for purifying and spinning spider silks and other CC structural proteins. Organic acids are used to lyse recombinant CC derived cells), and enrich the purity and yields of structural CC proteins by hydrolysing many of the macromolecules while leaving the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by ion exchange or affinity CC chromatography and processed into an aqueous-based mixture for CC fibre spinning. In the present case, the pQE((SP1)4/(SP2)1)4 gene CC was cloned into vector pQE-9 for recombinant expression in CC Escherichia coli, and recombinant silk protein was obtained in 97% CC purity using propionic acid and anion-exchange chromatography on CC including films, fibres, woven articles, sutures, ballistic crequires less time and smaller volumes of many materials collection, parachutes and parachute cords. The new method has CC the foilowing advantages over prior art; it involves fewer steps, CC crequires less time and smaller volumes of reagents, results in CC scale up, and the fibres are spun in an environmentally benign CC scale up, and the fibres are spun in an environmentally benign columns of the columns of the columns of the columns are spun in an environmentally benign columns of the columns are spun in an environmentally benign columns of the columns are spun in an environmentally benign columns of the columns are spun in an environmentally benign columns of the columns are spun in an environmentally benign columns.

recombinant slik protein, pOE(spl)7. The invention provides methods for purifying and spinning spider silks and other structural proteins. Organic acids are used to lyse recombinant cells or other biological samples (such as non-recombinantly The present sequence is that of orb-weaver spider (Nephila clavipes)

and enrich the purity and yields of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ion exchange chromatography. Products obtained using the methods of the invention can be used in the construction of many materials including films, fibres, woven articles, sutures, ballistic protection, parachutes and parachute cords. The new method has the following advantages over prior art: it involves fewer steps, requires less time and smaller volumes of reagents, results in better recovery of protein at higher purity (70-99%), is easy to scale up, and the fibres are spun in an environmentally benign solution reducing hazardous waste accumulation and cost.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins by hydrolysing many of the macromolecules while leaving the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by ion-exchange or affinity chromatography and processed into an aqueous-based mixture for fibre spinning. In the present case, the postspl) gene was closed to contact the postspl of the present case, the postspl of the present case is postspl.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chromatography and processed into an aqueous-based mixture for fibre spinning. In the present case, the princips gene was cloned into vector pET24 for recombinant expression in Escherichia coli, and recombinant silk protein was obtained using formic acid containing denaturant (3 M guanidine-HCl) and by affinity chromatography on nickel-NTA agarose. Products obtained using the methods of the invention can be used in the construction of many materials including films, fibres, woven articles, sutures,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cells or other biological samples (such as non-recombinantly derived cells), and enrich the purity and yields of structural proteins by hydrolysing many of the macromolecules while leaving the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by ion-exchange or affinity resulting lysate is further purified by ion-exchange or affinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is that of the orb-weaver spider (Nephila Clavipes) recombinant silk protein pETNCDS. The invention provides methods for purifying and spinning spider silks and other structural proteins. Organic acids are used to lyse recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ballistic protection, parachutes and parachute cords. The new method has the following advantages over prior art: it involves fewer steps, requires less time and smaller volumes of reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 2; Page 41-42; 49pp; English

                                       purity. Products obtained using the methods of the invention can be used in the construction of many materials including films, fibres, woven articles, sutures, ballistic protection, parachates and parachate cords. The new method has the following advantages over prior art: it involves fewer steps, requires less time and smaller volumes of reagents, results in better recovery of protein at higher purity (70-99%), is easy to safe, and the fibres are
                                                                                                                                                                                                                                                                                                                                   proteins by hydrolysing many of the macromolecules while leaving the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by ion-exchange or affinity chromatography and processed into an aqueous-based mixture for fibre spinning. In the present case, the pET((SP1)4/(SP2)1)4 gene was cloned into vector pET24 for recombinant expression in Escherichia coli, and recombinant silk protein was obtained in 75-75% purity using propionic acid and anion-exchange chromatography on QAE-Sephadex A50. When denaturant (3 M guanidine-HCl) was added
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is that of orb-weaver spider (Nephila clavipes) recombinant silk protein pET((SP1)4/(SP2)1)4. The invention provides methods for purifying and spider silks and other structural proteins. Organic acids are used to lyse recombinant cells or other biological samples (such as non-recombinantly derived cells), and enrich the purity and yields of structural
                                                                                                                                                                                                                                                                                                             t o

```

This sequence represents a synthetic spider dragline variant polymer. DP-1B.16. The sequence of the DP-1B.16 monomer is given in AAR99056. The polypeptide monomer is a variant based on a consensus sequence derived from the fibre forming regions of spider dragline protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC or Bacillus subtilis. Synthetic analogues of DPI were designed to mimic the repeating consensus sequence of the natural protein and the pattern CC of variation among individual repeats. This monomer exhibits all of the CC regularities of (1), (5) below. In addition, it exhibits a regularity of the natural sequence which is not shared by DP-1A, namely that a repeat CC in which both GYG and GRG are deleted is generally preceded by a repeat CC lacking the entire poly-alanine repeat, with one intervening repeat. CC The sequence of DP-1B matches the natural sequence more closely over CC a more extended segment than does DP-1A. The individual repeats differ CC from the consensus sequence given in AAW06201 according to the pattern: CC (1) the poly-alanine sequence varies in length from 0-7 CC (3) aside from the entire poly-alanine sequence is deleted, CC (3) aside from the poly-alanine sequence, deletions usually CC encompass integral multiples of three consecutive residues; (4) deletion of GYG is generally accompanied by deletion of GRG in the server serior and consecutive residues;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or Bacillus Subtilis. Synthetic analogues of DPI were designed to mimic the repeating consensus sequence of the natural protein and the pattern of variation among individual repeats. This monomer exhibits all of the regularities of (1)-(5) below. In addition, it exhibits a regularity of the natural sequence which is not shared by DP-1A, namely that a repeat in which both GYG and GRG are deleted is generally preceded by a repeat lacking the entire poly-alanine repeat, with one intervening repeat. The sequence of DP-1B matches the natural sequence more closely over a more extended segment than does DP-1A. The individual repeats differ from the consensus sequence given in ARMO6201 according to the pattern: (1) the poly-alanine sequence varies in length from 0-7 residues; (2) when the entire poly-alanine sequence is deleted, so also is the surrounding sequence encompassing AGRGGLGGGAAANGG;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a synthetic spider dragline variant polymer, DP-1B.9. The sequence of the DP-1B.9 monomer is given in AAR99054. The polypeptide monomer is a variant based on a consensus sequence derived from the fibre forming regions of spider dragline protein, esp. the natural protein 1 (Spidroin 1) from Nephila clavipes. The
                                                                                                                                                                                                                                                                 The proteins may be used to produce fibres of high tensile strength and elasticity, suitable for clothing, rope, surgical sutures, biomaterials for implants, plastic reinforcements, films, coatings, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Spider; dragline protein; variant; monomer; polymer; fibre forming region; Spidroin 1; Nephila clavipes; DDP; mimic; DDP-1A analogue; fibre; high tensile strength; elasticity; cloth rope; surgical suture; implant; reinforcement; film; coating.

                                                                  The present sequence represents a polymer of an analogue of the spider silk protein spidroine major 1. The protein improves the moisturizing/ softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins,
                                          hormones, mois
skin and hair.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score
